Tool travel recording

So that the quality is always right

How do you ensure the processing quality of each workpiece? The tool life plays an important role. But precisely tracking the running meters of each individual tool is an almost impossible task. Somehow, you also have to work.

The additional function „Tool Life Travel Recording“ makes it possible to easily define a limit of wear per tool in toolManager. The actual value is constantly updated per tool by the control system. When the wear limit is reached, the machine operator receives a warning.

So that you are not surprised by the wear limit in the middle of the job, the Tool Life Travel Recording allows you to additionally define an advance warning when a certain percentage of the wear limit is reached. This gives you sufficient lead time to take care of a replacement tool.
